

Varco never stops working on better ways to drill.

To be competitive in the oilfield of the future, drilling crews will have to be smarter than ever.

They'll use new technologies that make the drilling process safer and more productive — systems that mechanize, automate and greatly speed-up the business of making hole.

They'll put workers in environmentally-controlled cabins instead of on the rig floor, and they'll work with switches and joysticks instead of hammers and tongs.

They'll use more reliable microelectronics for precise, instant knowledge of everything that's happening in the drilling process.

The rigs of tomorrow will be safer, more productive and more profitable than ever before. How do we know? We're already equipping them with the tools and systems of the future.

To get a glimpse of the rigs of tomorrow, take a look at Varco today.

Advanced Varco equipment, systems and instrumentation — are working across the U.S. and around the world.
